Viñolas, A., Caballero–López, B., Masó, G., 2018. The collection of type specimens belonging to the subfamilies Alleculinae, Diaperinae and Lagriinae (Coleoptera, Tenebrionidae) in the Natural Sciences Museum of Barcelona, Spain. *Arxius de Miscel·lània Zoològica*, 16: 20–39.

Abstract

The collection of type specimens belonging to the subfamilies Alleculinae, Diaperinae and Lagriinae (Coleoptera, Tenebrionidae) hosted in the Natural Sciences Museum of Barcelona, Spain. The type collection of the subfamilies Alleculinae, Diaperinae and Lagriinae (Coleoptera, Tenebrionidae) deposited in the Natural Sciences Museum of Barcelona, Spain, was organised, revised and documented. The collection contains 201 type specimens of 35 taxa. Of note is the number of samples from a subfamily described by Francesc Español, Maurice Antoine, and Zoltán Kaszab. In this paper, we report the information available for these type specimens and all taxa (species or subspecies). We give the following information: original and current taxonomic status, original citation of type material, the exact transcription of the original label, and the preservation condition of the specimen. We also discuss the differences between the original descriptions and labels. If a taxonomic change has occurred, the references describing those changes are included at the end of the description.

Key words: Collection type, Coleoptera, Tenebrionidae, Alleculinae, Diaperinae, Lagriinae, subfamilies, Taxonomic revision

Resumen

Colección de ejemplares tipo de las subfamilias Alleculinae, Diaperinae y Lagriinae (Coleoptera, Tenebrionidae) depositados en el Museo de Ciencias Naturales de Barcelona, España. Se ha organizado, revisado y documentado la colección de especímenes tipo de las subfamilias Alleculinae, Diaperinae y Lagriinae (Coleoptera, Tenebrionidae) depositados en el Museo de Ciencias Naturales de Barcelona. La colección está constituida por 201 ejemplares tipo, con un total de 35 taxones. Debe destacarse la presencia de un gran número de especies de una subfamilia descrita por Francesc Español, Maurice Antoine y Zoltán Kaszab. En este trabajo se facilita toda la información disponible relacionada con estos especímenes tipo y, para todos los taxones (especies o subespecies), se incluye la siguiente información: situación taxonómica original y actual, cita original del material tipo, transcripción exacta de las etiquetas originales y estado de conservación de los ejemplares. Además, se discuten las diferencias existentes entre la descripción original y la etiqueta. Cuando se han producido cambios taxonómicos en la especie, se incluye la bibliografía correspondiente en el apartado de referencias.

Palabras clave: Colección de tipos, Coleoptera, Tenebrionidae, Subfamilias Alleculinae, Diaperinae, Lagriinae, Revisión taxonómica

Resum

Col·lecció d'exemplars tipus de les subfamílies Alleculinae, Diaperinae i Lagriinae (Coleoptera, Tenebrionidae) dipositats al Museu de Ciències Naturals de Barcelona, Espanya. S'ha organitzat, revisat i documentat la col·lecció d'espècimens tipus de les subfamílies Alleculinae, Diaperinae i Lagriinae (Coleoptera, Tenebrionidae) dipositats al Museu de Ciències Naturals de Barcelona. La col·lecció està constituïda per 201 exemplars tipus, amb un total de 35 tàxons. Hi destaca la presència d'un gran nombre d'espècies d'una subfamília descrita per Francesc Español, Maurice Antoine y Zoltán Kaszab. En aquest treball es facilita tota la informació disponible relacionada amb aquests espècimens tipus i, per a tots els tàxons (espècies o subespècies), s'inclou la informació següent: la situació taxonòmica original i l'actual, la citació original del material tipus, la transcripció exacta de les etiquetes originals i l'estat de conservació dels exemplars. A més a més, es discuteixen les diferències existents entre la descripció original i l'etiqueta. Quan s'han produït canvis taxonòmics en l'espècie, s'inclou la bibliografia corresponent a l'apartat de referències.

Paraules clau: Col·lecció tipus, Coleoptera, Tenebrionidae, Subfamílies Alleculinae, Diaperinae, Lagriinae, Revisió taxonòmica

Introduction

The arthropod collections in the Natural Sciences Museum of Barcelona (MCNB), Catalonia, Spain, house over 1.9 million specimens of arthropods, almost half of which are beetles (Coleoptera, Hexapoda). A decade ago we began to study the type specimens as part of an on-going effort to publish the types of all of the MCNB arthropod collection. The first collections to be revised were: Ptinidae (Coleoptera): 8,854 specimens and 498 taxa (Viñolas and Masó, 2013); Carabidae (Coleoptera), as follows: 431 specimens and 156 taxa (Viñolas and Masó, 2014); Dytiscidae, Histeridae, Hydraenidae and Staphylinidae (Coleoptera): 130 specimens and 66 taxa (Viñolas et al., 2014); and the superfamilies Scarabaeoidea, Buprestoidea, Byrrhoidea, Elateroidea, Cleroidea, Cucujoidea, Tenebrionoidea (except Tenebrionidae), Chrysomeloidea and Curculionoidea (Coleoptera): 533 specimens and 170 taxa (Viñolas et al., 2016); and Pimelinae (Tenebrionidae, Coleoptera): 438 specimens and 140 taxa (Viñolas et al., 2017a).

Here we discuss a sixth group, the subfamilies Lagriinae, Diaperinae and Alleculinae (Tenebrionidae), containing 201 specimens and 35 taxa. Due to the large number of taxa that the collection includes, the Tenebrionidae family was divided into subfamilies that will be discussed in this and future notes. The collection consists mainly of species described by specialists in this family, such as Maurice Antoine, Silvano Canzoneri, Francesc Español, Zoltán Kaszab, Carlo Koch, Hans Kulzer, Auguste Eugène Méquignon, Maurice Pic, and Manuel García de Viedma. The identification of further type specimens is the result of research carried out by Museum collaborators, including Pere Oromí and Amador Viñolas. Many older species had no designated holotype or lectotype and so, if not previously designated, a syntype was chosen. The depository museum or institution of the typical series has now been indicated.

The collection of the subfamilies Lagriinae, Diaperinae and Alleculinae (Tenebrionidae) was reorganised during this revision. Registration numbers were added to all dried specimens. The type specimens database was updated and soon will be available in GBIF.

Methodology

Each type specimen included in this revision is described using all available information regarding both its original and current taxonomic status. If a taxonomic change has occurred, a brief discussion is included. The references that discuss these changes are included in the bibliography. The systematics of Bouchard et al. (2011) are followed at suprageneric level and modern revisions have been consulted for each taxonomic group. The following information was examined and included for each taxon with type specimens in the Museum's collection:

- Original status: original taxonomic status.
- Present status: only if it has changed.
- Original type material citation: the literal transcription of the material type as stated in the original publication is shown in guillemets « ».
- Localities of type material in MCNB: localities of type specimens deposited in the collection with current toponym.
- Holotype depositary: the private or institutional collection in which the holotype is deposited, given in parentheses (—) if unknown.
- Type material contain the following details: register number, number of specimens (specified only if it is different from one), sex of each specimen, given in parentheses (—) if unknown; square brackets [] indicate the beginning and the end of the label, vertical bars are used to indicate the end of a line (|), a space is used between labels (| |) and a full stop between mounts (.). All the data on the label are quoted unless illegible ([?]). Additional information is added in parentheses: extracted aedeagus, separate abdomen, and comments about the preservation status of the specimen.
- Remarks: discrepancies between the original description and the specimen labels are mentioned herein. Other specific considerations may also be included.
- References: when a taxonomic change has occurred, the references that discuss these changes are listed.

Acknowledgements

Many thanks for the help and financial support provided in the review and reorganization of the collection of type specimens to: Anna Omedes, Director of the Natural Sciences Museum of Barcelona; Dacha Atienza, Collection Head and Research; Eulàlia Garcia Franquesa, Head Curator; and Montserrat Navarro and Emma Asensio for their help in the bibliographic search. We also owe many thanks to Josep Muñoz Batet for reviewing the final manuscript and idiomatic notes.
